

AUTOMATIC UPDATES

In Ubuntu, you can set up automatic updates to ensure your system stays up-to-date with the latest security patches and software updates. Ubuntu provides a package called "unattended-upgrades" that manages automatic updates for you.

HOW ?

```
sudo apt update
```

```
sudo apt install unattended-upgrades
```

```
sudo vi /etc/apt/apt.conf.d/50unattended-upgrades
```

By default, automatic updates are scheduled to run daily. You can modify the schedule by editing the following file: **sudo vi /etc/apt/apt.conf.d/20auto-upgrades**

—FROM—

```
APT::Periodic::Update-Package-Lists "1";
```

```
APT::Periodic::Unattended-Upgrade "1";
```

—TO—

```
APT::Periodic::Update-Package-Lists "2";
```

```
APT::Periodic::Unattended-Upgrade "2";
```

```
Unattended-Upgrade::Allowed-Origins {  
    "${distro_id}:${distro_codename}";  
    "${distro_id}:${distro_codename}-security";  
    // Extended Security Maintenance; doesn't necessarily exist for  
    // every release and this system may not have it installed, but if  
    // available, the policy for updates is such that unattended-upgrades  
    // should also install from here by default.  
    "${distro_id}ESMApports:${distro_codename}-apps-security";  
    "${distro_id}ESM:${distro_codename}-infra-security";  
    //  
    "${distro_id}:${distro_codename}-updates";  
    //  
    "${distro_id}:${distro_codename}-proposed";  
    //  
    "${distro_id}:${distro_codename}-backports";  
};
```
